Pink Flamingos

Flamingos have big legs. Flamingos have big beaks. Flamingos are so pink.

All Flamingos are found in tropical and subtropical areas. The eggs are oblong in shape, similar to that of a chicken.

Flamingos eat algae, small insects, and small crustaceans like shrimp. They live in big colonies for protection. Its main predator is man because it is vulnerable to habitat destruction.

**They are pink because they eat shrimp.
Flamingos are very social birds.
Flamingos live about 20 years. I hope we
could do this again.**
