

# *Mealworms!!!!*

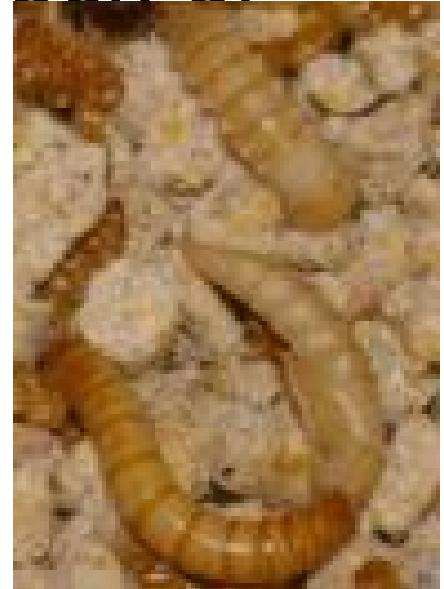

*The Darkling beetle lays eggs.  
Mealworms drink the potato and  
they eat wheat germ. We all got  
2 or 3 mealworms. Some  
mealworms died and they look  
like black worms.*

*By: Marlis*

*Mealworm hatch from their eggs. We don't get to see the eggs because they are so small. Some of the eggs are yellow and white. The eggs look like a little rock of sand.*

*When a mealworm turns into pupas they don't move at all. The pupa is white. It takes 2 weeks or more for a pupa to hatch. We never saw a pupa hatch.*

*When the pupas hatch they turn into white Darkling Beetles. Then they are red and finally they turn black. The beetles have 6 legs. Beetles have antennas on there head*
